# PROJECT DESCRIPTION

---

**UniFoodz** – Designed and developed the frontend of an intuitive mobile application to showcase and provide access to all food shops within the university campus. Built using Java, XML, and Android Studio, the app features:

- A **clean and visually appealing user interface** with a dynamic food-themed background.
- **Interactive buttons** for each food shop, ensuring smooth navigation and user engagement.
- A well-organized layout that enhances the **user experience** and aligns with best practices in UI/UX design.

This project refined my skills in **Android app development** and taught me to craft user-friendly interfaces that balance functionality and aesthetics.
